

**Bought a new tent for family recreation. Right on the box was a warning that said “ do not expose to sunlight for long periods of time ” WHAT ? The manufacturer recommends I do not use in the sun? And if I use it in sunlight, premature fabric failure is expected.**

**Thermo-shield to the rescue. I have coated this tent with Green, Orange, and White Thermo-shield. The fabric is now protected and greatly improved.**

**Thermo-shield on light tent fabric. Thermo-shield remains flexible allowing fabric to be stretched, folded, or packed away, like any normal tent.**

**The orange section was originally gray, the green section was orange, and the rain fly was gray.**

**My tents first test is in the extreme sunlight found in the red rock desert at Lake Powell. Being the last week of July temperatures are over 100 degrees.**

**Even in this extreme climate the inside of the tent stays just a couple of degrees warmer than the air temperatures. My wife could actually sleep in till 10:30 – 11:00 not being bothered by the extreme heat.**

# Camp Thermo Lake Powell 2008

**Thermo-shield Roof System on house boat "The Jobsite"**

**Thermo-shield Roof on "pop up shade"**

**Thermo-shield Stucco on deck and inside of speed boat "The Flying Squirrel"**

**Thermo-shield Roof on tent and rain fly**
